

A microscopic image of a mite, likely a dust mite, stained with a pink dye. The mite's body is translucent pink, and its legs are visible. To the right of the mite is a large, circular, pink-stained structure, possibly a spore or a cell. The background is a light, slightly textured surface.

Basement Pests and IAQ

**Jeffrey C. May, M.A. Principal Scientist
May Indoor Air Investigations LLC.
Tyngsborough, MA**

Since 1992
MAI has completed
more than 3000 building
inspections, including
more than 1,000
“sick building
investigations.”

We have taken and
analyzed by
microscopy over
35,000 air and dust
samples.

Basement Ecology

Damp from water entry

Damp from humidity

Moisture and chemicals from dryer

Neglected

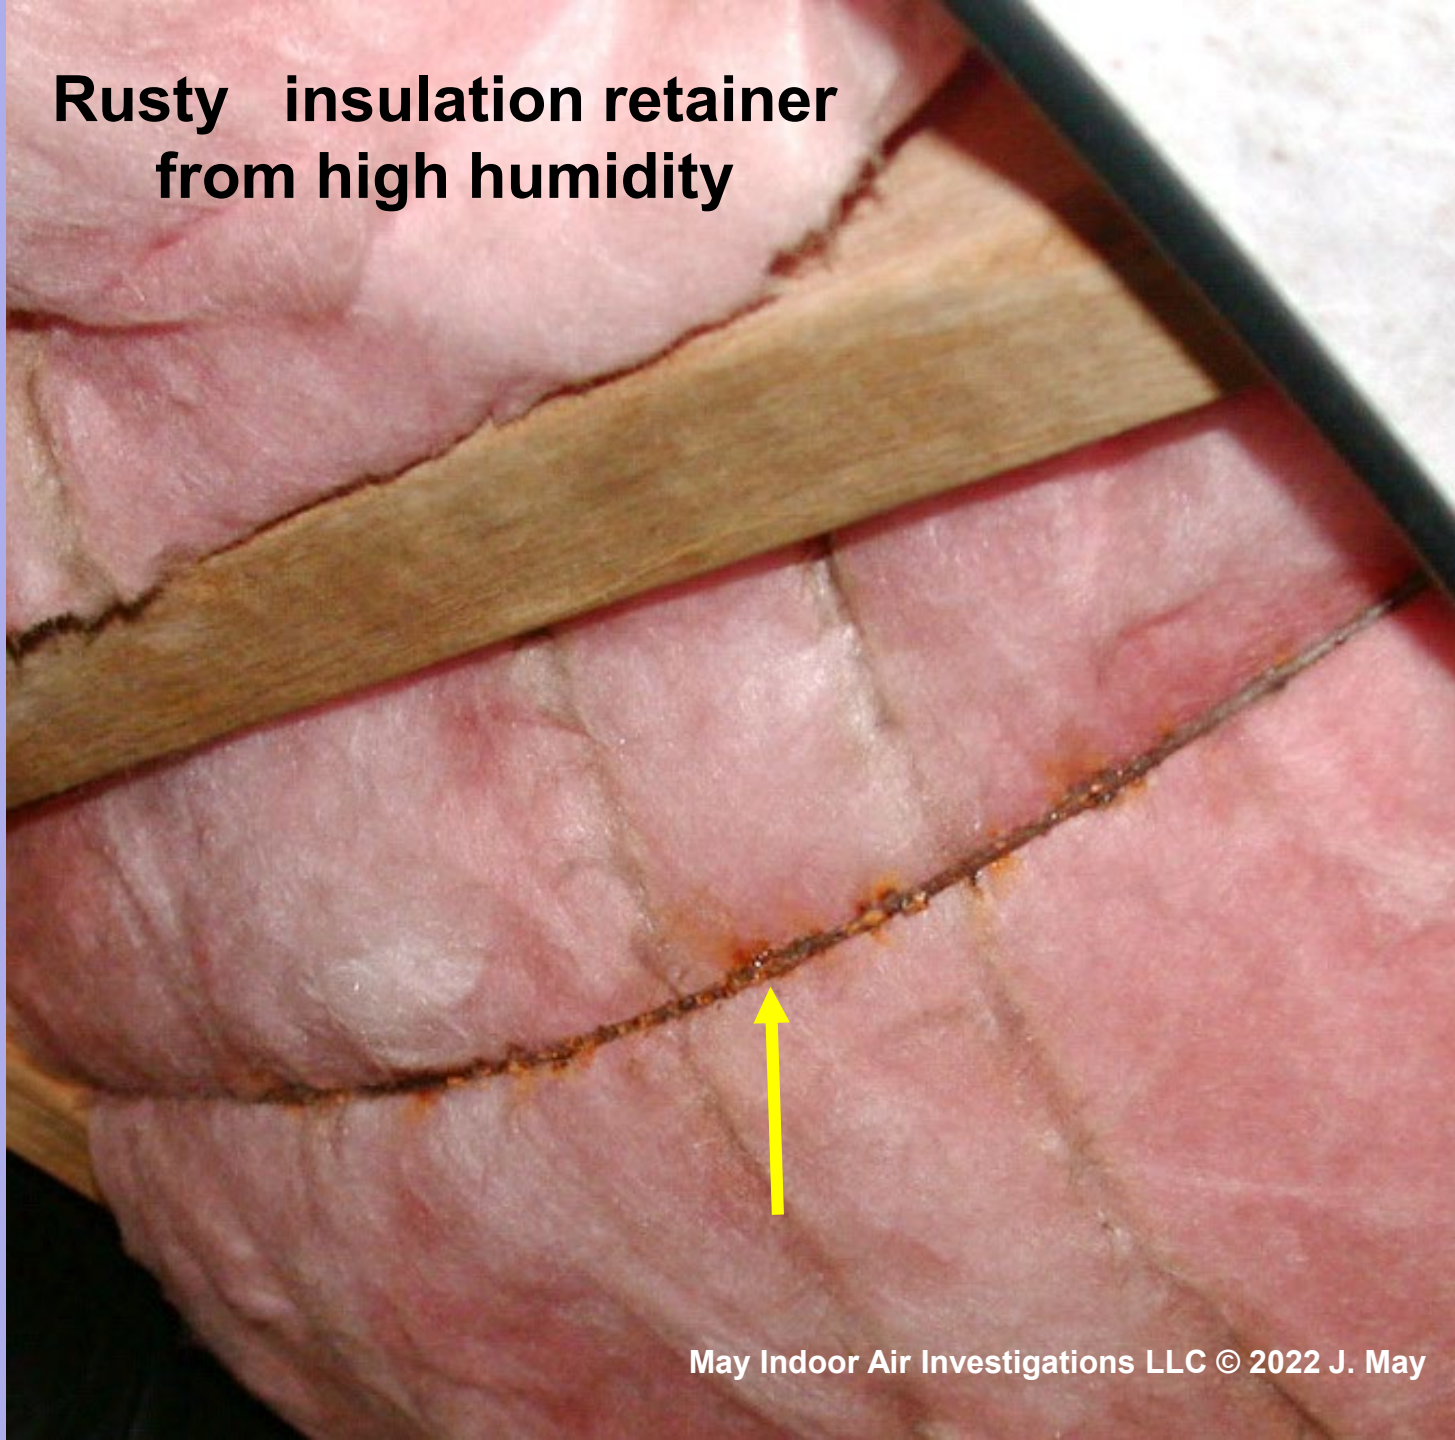

Overstuffed with stored goods

**Condensation on
bulb and
insulation, mold
on framing**

**Weather changed from cold
to hot and humid**

**Rusty insulation retainer
from high humidity**

Basements and Crawlspace must be dehumidified

RH should be no more than 50%

Condensation from high humidity

Lint may have laundry chemicals

May Indoor Air Investigations LLC

Basement Ecology

Damp from water entry:

Small crack with lots of water flow

roof valley

Foundation crack

Crawlspace Flooding

Significant roof-water flow inundated crack between concrete foundation pours

Crawlspace Flooding

**Do not ventilate
crawlspaces**

Damp from water entry

Tips to Stop basement water

**Over 90% of basement water problems
are due to roof water**

**Check exterior during heavy rain to see where water
ponds**

**Place a hose outdoors near an area where you have
water in the basement**

Consider installing a foundation skirt

Over 90% of basement water problems are due to roof water

A foundation skirt:

**Waterproof sheet
adhered to foundation
and sloped away**

Fig. 3-17 Surface water deflecting sheet.

Good drainage and grading are important but so is controlling relative humidity (RH) in the basement

Use dehumidification and keep the RH at no more than 50%

Basement Ecology

Damp from high humidity
Dehumidification is a must
but...

© 2022 J. May

May Indoor Air Investigations

**Dehumidifiers can get moldy
Dust + water = mold**

Basement Ecology Neglected

Over filled with stored goods

Use rolling metal shelving

Cardboard is
food

A photograph of a cluttered basement workshop. On the left is a black table saw with a wooden top. A broom with a blue handle and a light-colored head leans against the wall behind it. To the right is a wooden stool with a dark brown seat. The floor is concrete and covered with sawdust and various tools. The background shows a brick wall and some papers or a map hanging on it.

Basement Ecology

Activities:
Sawing wood

Sawdust is food:
Use vacuum
collection

Basement Ecology

Rodents:

Mice

Shrews

Termites and Ants

Microarthropods:

Carpet beetles

Booklice

Mites

Insects

Wool Moths

Basement Ecology

Pest entry in a bulkhead

Openings around bulkhead framing are very common

Mouse Motel 6

Pest entry at A/C lines

**Mice are Pests. .
for more than
one
reason**

The reddish stains on the concrete under and to the right of the main beam are mouse urine trails

Mice communicate through mouse urine trails. The trails are associated with odor and allergens.

<http://cen.acs.org/articles/89/i40/Mice-Urine-Powers-Social-Networking.html>

Mouse urine trails

Homes with elevated levels of mouse allergens are associated with more frequent asthma symptoms.

Salo, P.M., Jaramillo, R., Cohn, R.D., London, S.J., Zeldin, D.C., 2009, "Exposure to Mouse Allergen in U.S. Homes Associated with Asthma Symptoms," *Environmental Health Perspectives*. 117(3):387-391.

Mice

**Mouse-urine trails
contain mouse
allergens on DUST**

Aspergillus conidiophore and spores in mouse urine-trail (wet dust!)

Mice are Pests. .

Aspergillus conidiophore in mouse-urine trail

Shrews

Musky or . . .

Musty!

**A New Source of
Foul Odors in
Buildings**

Shrews

Find the entry with a mirror and flashlight

Shrews

Rodent burrow

odors

Shrews in Crawl Space

Bathroom access

Droppings

No mold on crawl space

Shrews in Crawl Space

Droppings

Access to insulated parlor-floor cavity

Avoiding mouse and shrew problems

Check exterior for openings (flashlight and mirror are very useful)

Seal openings with appropriate materials:

Copper wool, wood, masonry, or foam with embedded metal mesh

Store feeds, etc. in tight metal cans

Check that ridge and soffit vents are pest tight

Intact garage gaskets

No openings around garage pipes ducts or electric cables

Pest Exclusion on Garage Door

Termites Shelter Tubes

Termite workers are numerous but are blind and defenseless so they never exit the sand shelter tubes they build

Worker Termites in a Shelter Tube

When there is a break in the tube, soldier termites appear to fend off intruders (not shown)

Termite Ecology

Termites are in southern Maine and moving north
Termites may occur in southern Vermont

Prefer damp or decaying wood

Always associated with sand so you can
distinguish termite galleries from ant galleries by crumbling the frass

Prevention: no wood buried in soil, inspect perimeter of exterior and
basement

At least 2 inches, preferably 4 to 6 inches foundation visible
In spring produce winged reproductive

Nests are several feet underground; can be under a floor slab
Not aware of subterranean termites (*Reticulitermes virginicus*) allergens
but Formosan termites (*Coptotermes formosanus*, found mostly in the
South) have allergens that can cross-react with some cockroach allergens

Termites eat paper!

← New tube
on
replaced
panel

Termites

Termite Treatment

Broadcast spraying not allowed

Rodding with chemicals outside of foundation every few feet, block walls into cores, basement floors at the perimeter to create barrier

Odor of moldy wood acts as an attractant

Termite drill holes in concrete

Powder post beetles

Frass is very fine powdery brown dust readily aerosolized

No info on allergens

May Indoor Air Investigations

Female “tastes” wood and if starch and/or sugars present, lays eggs in sapwood (layer under bark)

An egg hatches and the larva burrows through wood leaving galleries filled with frass

The frass consists of wood dust with starches and sugars removed

A larva undergoes metamorphosis and turns into a beetle that chews through the wood surface, leaving a small round hole.

Beetles rarely re-infest so damage is almost always old.

Generally no treatment needed

Carpenter Ants

Carpenter ant

Courtesy of the National Pest Management Association / Tom Myers

Carpenter ant frass

© 2022 J. May

Frass consists of similarly sized shards of wood

No info on allergens

Carpenter Ants

Ants like termites produce winged reproductives

Pieces of ants often found in frass

Future queens
(smaller ants)

Carpenter Ants

To avoid carpenter ants, avoid damp wood

Treat with ant cups or borax

Be patient, follow ants carrying food back to nest

Dust is the Devil!!

What is dust?

Skin scales and pet dander

Inorganic particles (soil plaster, etc.)

Lint fibers (cellulose, cotton, etc.)

Sawdust in Basements

Pollen grains

Mold spores

Bug detritus

What is dust?

Dust is food for a host of microorganisms and microarthropods

Skin and pet dander are fat and protein

Pollen contains starch

Sawdust and Lint contain cellulose

**Mold spores can serve as food for
microarthropods**

Basements are dusty!!!

Microarthropods

“Fresh” dust is homogeneous

“Old” dust is heterogeneous

When microarthropods forage, dust appears “plotchy” rather than evenly spread due to presence of fecal pellets

House Dust Mite

**Feed on skin scales,
Pet dander**

**Any high protein source
Including fish flakes**

**Must have high humidity
(above 70%)**

**Usually found in:
Mattresses
Quilts
Pillows
Cushioned chairs**

**Wherever body warmth
and moisture are provided**

Case Study

- 70+ year-old retired surgeon referred by allergist.
- Mild asthma and disabling rhinitis.
- Experienced sudden symptoms in den.
- 25 gallon tropical fish tank in den.

- Fish food flakes all around tank and on cover.
- Live dust mites crawling around fish tank.
- Underside of tank cover covered with mite fecal pellets.

Mite and mite fecal pellets from dust around kitchen-sink rim

Fecal pellets contain digestive enzymes that are the main allergens

Dust-mite egg and mite fecal pellets from dust around kitchen-sink rim

Mite fecal from a carpet

Skin

**Colonization not usual in carpets unless
carpet is over crawl space or slab**

Are Spiders Good?

white droppings under web

SPIDERS

Misconception:

“Lots of spiders indoors is a good thing.”

Facts:

Spiders only eat live “insects.”

Spiders are at the top of the arthropod food chain

Bites may cause allergic reaction.

Spiders

Spiders are “liquid” feeders; inject digestive enzymes and suck out fluid

Spider-web net at ceiling means mites living on joist mold

Spider Droppings

Spider Droppings consist primarily of guanine crystals ~2 microns in size.

The crystals are stuck together possibly by allergen.

How Do We Avoid Having Microarthropods?

- **Eliminate dust from hard surfaces, including walls, trim and furniture**
- **Avoid wall-to-wall carpeting, especially below grade**
- **Keep the relative humidity no higher than 50%**
- **Droppings may be allergenic**

homes**

Cross Reactivity

Asian ladybugs in a bulkhead

© 2022J. May

Asian ladybug and cockroach

If you are allergic to roaches, you are allergic to ladybugs

J. Allergy Clin. Immunol. 2007 Feb;119(2):421-7, *Asian ladybugs (Harmonia axyridis): a new seasonal indoor allergen.* Nakazawa T, Satinover SM, Naccara L, Goddard L, Dragulev BP, Peters E, Platts-Mills TA.

Book Lice

Allergy to book lice

Musken, H., Franz, J-Th., Fernandez-Caldas, E., Masuch, G., Maranon, F. Bergmann, K-C. 1998. Psocoptera. Allergologie, 21: 381-382.

Book lice are very common, barely visible indoor pests

125-micron insect fecal full of pollen from a baseboard convector

pollen

Actinomycetes

Actinomycetes are microorganisms that require high moisture conditions, very frequently found on foundation walls

Actinomycetes

Actinomycetes are microorganisms related to bacteria but grow like molds with hyphae and spores.

Actinomycetes

Inhalation exposures to one species of actinomycetes are associated with hypersensitivity pneumonitis.

Actinomycetes →
in basement air

← Eurotium mold spores

Actinomycetes on
cellulose fibers →
are very common on
foundation
walls.

Problematic organisms that may cause allergy can often be observed by microscopy. They are not generally reported in “spore counts” and may not be culturable.

Actinomycetes in basement air

Large bacteria in bedroom air
